

## **Practical 7**

**Roll No : 18**

**Enrollment No : 1801160067**

**Name : Mahendra Maruti Sawant**

**Course Code : CO 6 I**

**Subject : WBP**

**Subject code :22619**

**Write a Simple PHP program to create pdf Document by using graphics concepts.**

To Create PDF File in PHP FPDF is used.

### **What is FPDF?**

FPDF is a PHP class which allows to generate PDF files with pure PHP that is to say without using the PDFlib library. F from FPDF stands for Free: you may use it for any kind of usage and modify it to suit your needs.

FPDF has other advantages: high level functions. Here is a list of its main features:

- Choice of measure unit, page format and margins
- Page header and footer management
- Automatic page break
- Image support(JPEG, PNG and GIF)
- Colors
- Links
- TrueType, Type1 and encoding support
- Page compression

### **Program Code:**

```
<?php
    require('fpdf.php');
    $pdf = new FPDF();
    $pdf->AddPage();
    $pdf->SetFont('Arial','B',16);
    $pdf->Cell(40,10,'This PDF file made by Mahendra Sawant');
    $pdf->Output();
?>
```

## Output:-
